METERING PUMPS

P N E U M A T I C P L U N G E R

General Specifications: 84T-17, 18 & 20 Series Pneumatic, Plunger Metering Pumps

Wetted Parts:

Pump Body:	316 ss
Plunger:	17-4 PH ss, or Ceramic Coated
Plunger Seal:	Refer to Ordering Chart

Check Valves :

Body:	316 ss
Ball:	440C ss or Carbide
Spring - Discharge:	316 ss
Seat:	TFE

Pneumatic Section:

Piston Housing:	303 ss
Timer:	316 ss
Relay:	316 ss

Plunger Sizes: 1" to 2 1/4" plunger diameters

Pressure: To 10,000 psi, maximum

Optional Materials: 316 ss, Hastelloy, Monel, & Titanium

The LINC 84T-17, 18 & 20 Series: Pneumatic, Plunger-Type Metering Pump Selection Chart

Notes:

- Maximum rates are based on maximum strokes per minute per pump.
- Minimum rates are calculated as follows:
1" plunger pumps are 1/4" stroke length and a minimum of 4 strokes per minute.
1-1/2" and 2-1/4" plunger pumps are 1/2" stroke length and a minimum of 4 strokes per minute.
- The timer supply pressure is 20 to 100 psi.
- The relay supply pressure range is 50 to 180 psi.
- When creating a Model Number using the Ordering Chart, the "x" in the Model Number column above will be replaced by a single digit representing the plunger seal selection. The plunger seal is shown in the Ordering Chart.

METERING PUMPS

P N E U M A T I C P L U N G E R

Ordering Chart: LINC 84T-17, 18 & 20 Series Pneumatic Plunger Metering Pump

Series:

84T - Pneumatic, plunger type metering pump

Plunger Diameter:

- 17 - 1" plunger diameter
- 18 - 1-1/2" plunger diameter
- 20 - 2-1/4" plunger diameter

Plunger Seal:

- 1 - Packing mechanical seal - Fluorocarbon, wetted o-rings - Fluorocarbon
- 2 - Packing mechanical seal - Fluoromyte, wetted o-rings - TFE
- 3 - Packing mechanical seal - Nitrile, wetted o-rings - Nitrile
- 4 - Packing mechanical seal - TFE/Graphite, wetted o-rings - TFE
- 5 - Specify your requirements
- 6 - Packing mechanical seal - Ultra High Molecular Weight Polyethylene, wetted o-rings - TFE
- 7 - O-rings packing seal - Fluorocarbon, wetted o-rings - Fluorocarbon
- 8 - O-rings packing seal - Nitrile, wetted o-rings - Nitrile
- 9 - O-rings packing seal - Kalrez, wetted o-rings - Kalrez

Piston Size:

- 4 - 4" piston diameter
- 6 - 6" piston diameter
- 8 - 8" piston diameter
- 10 - 10" piston diameter

Other:

- 5 - Specify your requirements
- 9 - All 316 ss pump/timer/relay (when required)

Option Number:

- () - If the pump does not require any special modifications, Omit "Option Number" from the part number. If the pump does require special modifications, use "5" for "Other", and "(x)" for the Option Number when placing an order. The factory will replace the "(x)" with a unique option code at the time of pump production. Example 84T-17-46-5(7).

LINC 84T-____-____-____ ()

Example: LINC 84T-17-46-6 Pneumatic Metering Pump

METERING PUMPS

PNEUMATIC PLUNGER

Scope Of This Manual:

This manual describes and provides instructions and parts list for the LINC84T-17, 84T-18 and the 84T-20 Series Chemical Metering Pump. These pumps are pneumatically operated plunger pumps.

Installation:

These pumps require a flooded suction and must be located lower than the chemical supply tank. Vertical installation of the piston housing is required.

1. Connect the suction line through a filter or strainer to the suction check valve (fig. 1, item 22).
2. Connect the discharge line from the discharge check valve to the desired location (fig. 1, item 21).

Note: An in-line check valve at the point of injection is recommended to prevent back blow to the pump during shutdown or servicing.

3. Connect supply pressure to the timer and both relays (fig. 1, item 1). Air is the recommended supply; however, any dry filtered gas may be used. The supplies to the timer and relay must be separate. Two filter-regulators are required, one to control the supply pressure to the timer and another to control the supply pressure to the relay. The supply pressure to the timer should be between 20 psig and 100 psig. The supply pressure to

the relay should be between 50 psig and 180 psig.

4. Using the regulator that feeds the supply to the relay, set the supply pressure to overcome the discharge pressure of the pump. See "How To Determine Supply Pressure" in this section of the manual.
5. The timer can be set to stroke the pump between 4 strokes/minute and the maximum rate for the particular pump being used. See the selection chart in this section of the manual.
6. The stroke length is adjusted by rotating the stroke adjustment screw. Assure that the control knob on the timer is set so that the pump will not stroke over the maximum strokes per minute. Slowly increase the supply to the timer, using the regulator that feeds the timer, until the pump begins to stroke smoothly. This pressure should be equal to or slightly less than the supply to the relays.
7. To prime the pump, loosen the bleed screw (fig. 1, item 23). Allow the liquid (chemical) to flow into the pump chamber, venting the trapped air or gas. Tighten the bleed screw. Start the pump and run for a minimum of one minute. Open the bleed screw again and evacuate all the remaining air or gas from the pump chamber.
8. Using a rate gauge, set the desired pumping rate by adjusting the timer knob and stroke adjustment screw. The timer can be set to stroke the pump from 4 strokes/minute to the maximum rate for the particular pump being used. The stroke length is adjusted by rotating the stroke adjustment screw on top of the piston housing (fig. 1, item 6). Loosen the jam nut and adjust the stroke adjustment screw as necessary (fig. 1, item 7). Lock down the jam nut after any adjustments are made.

Note: The minimum stroke on the 84T-17 is 1/4" and 1/2" on the 84T-18 and 84T-20.

Maintenance:

Refer to all sectional drawing and parts list in this manual. All repairs should be performed in a clean environment.

The following steps must be taken before proceeding with any maintenance operations:

Removing the Pump from Service:

1. Rotate the control knob on the timer to the "O" position.
2. Disconnect the supply pressure from the timer and relay.
3. Close the upstream and downstream valves on the chemical lines.

METERING PUMPS

PNEUMATIC PLUNGER

4. Open the bleed screw to release the pressure in the pump.
5. Disconnect the suction and discharge lines from the check valves.

Timer, Figure 1, item 1 & Figure 2:

1. Disconnect the supply pressure from the timer.
2. Rotate the timer counter clockwise on the pipe nipple that connects it to the relays until the timer is vertical with the supply pressure port pointing down.
3. Loosen and remove the two screws from the timer (fig. 2, item 1).
4. Separate the three timer sections and discard the seal, diaphragm and the disc (fig. 2, items 4, 6 & 15). Be careful not to lose the small disc spring (fig. 2, item 16). Note the orientation of the diaphragm as it is removed.
5. Loosen the set screw on the knob (fig. 2, item 11). Remove the knob and knob spring (fig. 2, item 9).
6. Unscrew the adjustment screw (fig. 2, item 10) from the front body (fig. 2, item 13). Remove and discard the o-ring (fig. 2, item 12).
7. Reassemble the timer in reverse order of the above steps using new rubber parts. Lubricate the adjustment screw threads and its o-ring. No other lubrication is required.
8. After installing the adjustment screw, turn it in by hand, without the knob installed until it lightly seats. During this operation do not over tighten the adjustment screw into its seat. Apply supply pressure to the timer and unscrew the adjustment screw slowly until the pump starts to run. Trial and error will be necessary to determine the proper orientation of the knob on the adjustment screw. Once the proper orientation is determined, reinstall the knob spring and knob.

Relays:

Note: If your pump was manufactured prior to 9-01-2001, it was manufactured with a "Double-Acting-Relay", use Relay Procedure "A" to service this type. If your pump was manufactured after 09-01-2001, it was manufactured with two "Single-Acting-Relays", use Relay Procedure "B" to service this type.

Relay Procedure A: (DOUBLE ACTING)

Figure 1, item 1 & Figure 3:

1. Disconnect the supply pressure from the relay.
2. Disconnect the tubing (fig. 1, items 2 & 3) between the relay and center ring (fig. 1, item 12).
3. Unscrew the relay from the nipple that connect it to the piston housing (fig. 1, item 8)

4. If the relay is not functioning properly and/or is leaking, the parts in the repair kit #24284 should be replaced (fig. 3, item 6, 14, 15, & 16). This repair kit consists of three o-rings, a piston seal, spring and two poppets.
5. Remove the four socket head screws that hold the lid on the relay (fig. 3, items 13 & 1). Also remove the four socket head screws that hold the three body sections together (fig. 3, item 10). Note the location of all ports so that the location can be the same when the unit is reassembled. Separate the body parts and the lid. Remove the lock nut which will allow each individual part to be inspected (fig. 3, item 3). Replace the old parts with the parts from the new repair kit and reassemble. Special care should be taken to see that each part especially the piston spacer and the seal spacer is put back into the same location when reassembling (fig. 3, items 5 & 7).
6. To test the relay prior to reassembly, connect the supply to the port marked "IN". Supply should be routed to the port marked "OUT 1" with no leakage to the port marked "E1". Connect the pressure to 1/8" NPT port in the lid. Supply should be routed to the port marked "OUT 2" with no leakage to

METERING PUMPS

P N E U M A T I C P L U N G E R

port marked "E2".

7. Reinstall the relay on the nipple on the pump piston housing. Making sure that the nipple is connected to the proper port on the relay, port marked "OUT 2", and that the port marked "OUT 1" is connected to the tubing that goes between the relay and the center ring below the piston housing.

Relay Procedure "B": (TWO SINGLE ACTING)

Figure 1, item 1 & Fig. 4 & 5:

1. Disconnect the supply pressure from the relay.
2. Disconnect the timer/relay assembly from the top and bottom of the pump piston housing. (fig. 1, items 8 & 12).
3. Remove both relays from all fittings in the assembly for inspection.
4. If either or both relays are not functioning properly, replace the old parts with new one included in the repair kits # 25182 & #25418. This repair kit contains o-rings, piston seals, spring and poppet.
5. Remove the four capscrews that hold the lid on the relay (fig. 4, item 10 and/or fig. 5, item 10).

Note the location of all ports so that the correct orientation can be reestablished when the relay is reassembled.

Separate the body parts and the lid. Remove the lock nut which will allow each individual part to be inspected (fig. 4 & 5, item 3). Replace the old parts with new ones from the repair kit, and reassemble the relay.

6. To test the relays prior to assembling them to the pump, follow these steps. Put a 1/4" pipe plug into port #2. Connect supply pressure to port #1. There should be no leakage to port #3. Leaving supply pressure on port #1, and removing the pipe plug from port #2. Apply supply pressure also to port #4 (1/8" NPT) in the lid. After a short blast of air as the poppet shifts, there should be no leakage out of port #2.
7. Connect the relays with the timer/relay assembly to the pump as they were prior to disassembly. Make sure that the longer of the two relays is installed on the top of the pump piston housing with the shorter relay on the bottom. Also make sure that the fittings are connected to the proper ports and installed according to the assembly. (fig. 1)

Suction Check Valve, Figure 1, item 22 & Figure 7:

1. Disconnect the piping from the check valve.
2. Unscrew the check valve body from the pump (fig. 7, item 1).
3. Remove and discard the o-rings (fig. 7, items 2 & 4).
4. Inspect the ball for damage (fig. 4, item 3). Replace if necessary. Reassemble the check valve using new o-ring. If the seat o-ring is Teflon, install it onto the check valve body (fig. 7, item 1) and "peen" the ball into the seat to ensure proper sealing.

Note: The suction check valve on Models 84-18 & 84-20 are metal seats; therefore, do not use an o-ring.

5. Install the repaired suction check valve into the pump body. Tighten securely.

Discharge Check Valve, Two-Piece, Figure 1, item 21 & Figure 6:

1. Separate the two halves of the check valve (fig. 6, items 4 & 1).
2. Replace the o-rings, ball and spring as required (fig. 6, items 2, 3, 5 & 6). The Teflon o-ring may be removed, turned around and reused if a new o-ring is not available (fig. 6, item 2). During this procedure, extreme care should be

METERING PUMPS

PNEUMATIC PLUNGER

exercised. The ball should be "peened" on the Teflon seat to ensure proper sealing (fig. 6, items 1, 5 & 2).

3. Ensure that the proper flow direction, as marked on the valve body is observed when installing or replacing this check valve.
4. Install repaired discharge check valve into the pump body. Tighten securely.

Piston/Plunger, Figure 1, item 9, 27, 28, 29 & 30:

1. Secure the pump body in a vise.
2. Remove the tubing (fig. 1, items 2 & 3) between the relay and the center ring (fig. 1, item 12).
3. Remove the piston housing screws (fig. 1, item 13). Grasp the piston housing and pull up to remove (fig. 1, item 8) and pull up to remove.
4. Grasp the piston (fig. 1, item 9) and pull away from the pump body assembly to remove. Inspect the plunger for wear, especially longitudinal grooves. Replace the plunger if necessary.

Note: The piston and plunger on the Model 84T-17 is a single piece and must be replaced as a unit. On Models 84T-18 & 84T-20 the plunger is a separate piece. To remove the plunger (fig. 1, item 30) from the piston (fig. 1, item 9) loosen the set screws (fig. 1, item 27) and twist out the piston cap (fig. 1, item

28). The plunger will now screw out of the piston. Inspect the piston u-cups and piston-plunger o-ring (fig. 1, items 10 & 29). Replace if necessary.

Plunger Seal, Figure 1, item 18 & 19:

1. With a pipe or strap wrench, separate the three sections of the pump main body assembly (fig. 1, item 11, 17 & 20).
2. Carefully remove the two plunger seals (fig. 1, item 19) and the two plunger seal backups (fig. 1, item 18). One set will be in the center housing adapter (fig. 1, item 11) and the other set will be in the lower body (fig. 1, item 20 or 31). Inspect for wear or deterioration from being attacked by the chemical the pump is pumping.
3. Replace the plunger seal.

Note: The expander ring side of the plunger seal must be facing the pressure. This means that the lower seal will have the expander ring side down toward the suction check valve and the upper seal will have the expander ring side up toward the piston housing. If needed, also replace the plunger seal backup. Extreme care should be taken not to scratch or distort these parts.

4. Reassemble the three sections of the pump body assembly. Tighten securely.

Reassemble the Pump:

1. Lubricate the piston u-cup and piston assembly with light oil to protect against possible damage during assembly.
2. Reassemble the piston/plunger assembly and install into the pump body assembly. See Figure 1 for correct assembly.
3. Replace the piston housing and secure with the piston housing screws.
4. Assure that the piston housing is oriented so that the tubing will reconnect properly to the timer/relay assembly.
5. If the bleed screw has been removed, install and tighten securely.

Plunger and Plunger Seal Lubrication:

1. Remove the plug from the pump body (fig. 1, item 24).
2. Add silicone base lubricant (Dow Corning DC-7, part #10354) or equal into the port where the plug was removed. Approximately 1 oz. will be required for each refill. Replace the plug.
3. Silicone lubricant should be added every 4 - 6 weeks depending upon operation conditions.

Note: Do not use a grease gun or any metal tool to insert the lubricant into the pump to prevent damage to the plunger or plunger seal.

METERING PUMPS

P N E U M A T I C P L U N G E R

IMPORTANT: How To Determine Supply Pressure:

The theoretical amplification ratio shown in the Selection Chart of this manual is the area of the piston divided by the area of the plunger. This amplification ration is used to determine how much gas supply pressure is required to enable the pump to generate the required liquid discharge pressure. The theoretical gas supply pressure required to generate a specific liquid discharge pressure is calculated by dividing the required liquid pressure by the amplification ratio. However, the amplification ratio is a theoretical number and in an actual application, other factors such as friction and stroke rate require that a higher gas supply pressure be used.

To determine the approximate gas supply pressure to the relay, add 30 PSI (up to 40 PSI for higher pump stroke rates) to the calculated theoretical gas supply pressure.

For example, if it is required to generate 6000 PSI with an 84T-17-X8 pump, follow the procedure below to determine the approximate gas supply pressure that must be used.

The required liquid discharge pressure divided by the theoretical amplification ratio = 6000 PSI divided by 64 = 94 PSI. Now add 30 PSI to the theoretical 94 PSI. Therefore the actual gas supply pressure is 94 PSI + 30 PSI = 124 PSI.

The supply pressure to the timer of the 84T should be set high enough to make the relay stroke reliably. The timer supply pressure should be approximately 10 psi higher than the relay supply pressure.
